

Using asp.net core, C#, SQL Server and angular to create employee management task

- this task can create, update and delete an employee and Return all employees from database to table
- this task can add basic information such as (Full Name, Phone, National Id, Address and Email) For every employee
- And his family members such as (Name, Age and his relationship with the employee) For every member
- The task can calculate Employee's Birthdate and age from his national Id
